FLAT-ROLLED

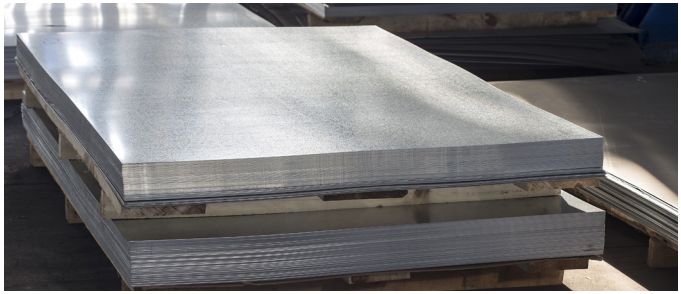
Flat out Better ERP for Metal Centers

Slitting

Slitting is the process of reducing Master coils into smaller individual tolerances cuts for further downstream processing.

Cut-to-length

This process converts slit coil into sheets for multiple uses, including compound stamping and laser cutting. The coil is processed through a leveler to improve flatness and remove coil set and then cut into lengths.



Packaging

Inventory needs special consideration in packaging, handling, and storage. Our system handling of process and procedures ensure quality and traceability of inventory, packaging specification, testing and certification retention, with careful consideration to customer instruction and requirements in placement and loading to minimize any external stress or damage to end product.

iMetal Complete Flat-Rolled Solution

- Sales Quote / Order CRM
- Toll Processing
- Inventory Control
- Purchasing / Stock Forecasting / Planning
- Production / Multi Stage / Outside Processing
- Production Planning with Time EST vs Actual
- Multiple Specifications / Certifications
- Physical / Chemical Properties
- Shipping / Dispatch
- Full Traceability

- Forward looking management
- Respond effectively to situations

31% Infrastructure cost savings average vs onsite

62% More efficient IT infrastructure management vs on premises

Our customers don't care how much we know, until they know how much we care

Our client facing team members have many years of experience working in and supplying the metals sector with functionally specific software. Our consultants are focused on delivering results with minimum cost and maximum attention to detail, ensuring you get a return on your investment, not just a good-looking set of screens.

It is this distinction that puts Jonas Metals Software ahead of other suppliers who offer generic solutions to the specialist sector.

If you need a system that works for you, not against you... call us today!
